SPRING BREAK!!!!

Coding Lab 2: jQuery Mobile

Winston Boucher | Yujie Hong
Spring 2016

Today

- ★ Get acquainted with jQuery Mobile
- ★ Learn how to use **mobile-oriented features** for your web apps
- ★ Specifically, learn about easy **mobile UI**, easy **navigation**, and easy **transitions**
- ★ jQuery Mobile **makes your life easier**

Why Mobile Web Apps?

- Way less code than native mobile development
- You have plenty of web experience from programming assignments
- Only need client-side code
- Allows more focus on design of site instead of debugging
- Even Windows Phone users can use your site

jQuery vs jQuery Mobile

- Used in your **HTML**, not your JS
- jQuery ≠ jQuery Mobile
- “jQuery Mobile is not the mobile version of jQuery”
- jQuery = easy JavaScript functionality (accessing elements, JSON, etc.)
- jQuery Mobile = **easy mobile UI features** (transitions, touch-friendly layout)
- You **need both** in your HTML file!

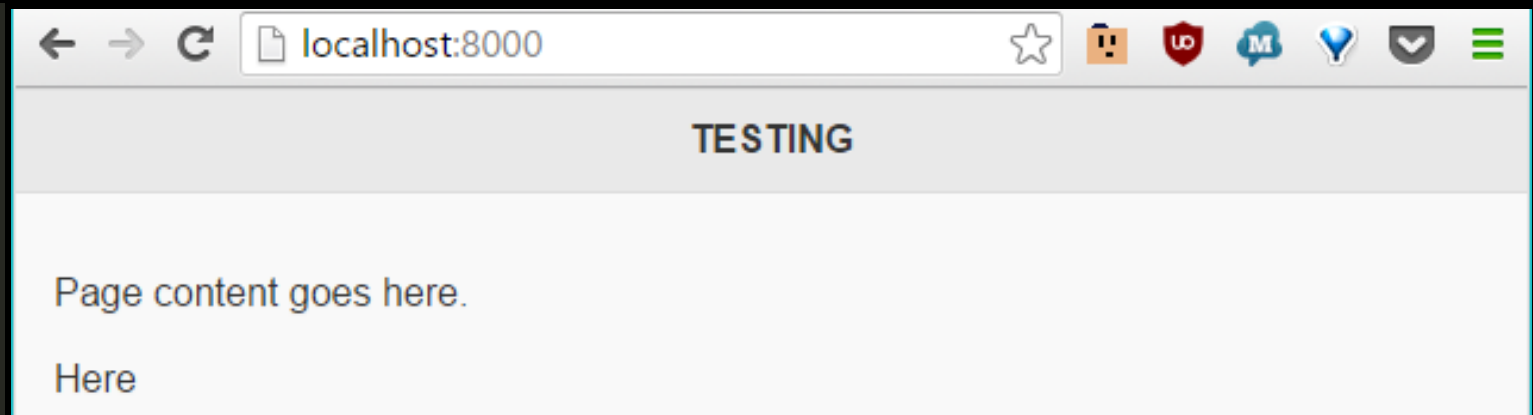

jQuery Mobile

- Compatible with everything
- Only uses HTML5 code (for what you'll need)
- You can use it in conjunction with your CSS
- Why is it called jQuery Mobile if it doesn't use JavaScript
- Because it's stupid
- Also because it has some extra JS features

UI in HTML5

- Inline data attributes
- e.g. `<div data-role = "content">`
- You will implement all functionality in the HTML itself

```
<div data-role="page">  
  
  <div data-role="header">  
    <h1>TESTING</h1>  
  </div>  
  
  <div data-role="content">  
    <p>Page content goes here.</p>  
  </div>  
</div>
```

Data-Role

- Determines the type of content and the UI to accompany it
- Use in HTML like `<div data-role="header">`
- Possibilities include “header”, “footer”, “content”, “listview”, “navbar”, etc.
- Many options here:
- <http://demos.jquerymobile.com/1.2.0/docs/api/data-attributes.html>

Starter Page

TEST PAGE

Page content goes here.

Here

- [Acura](#)
- [Audi](#)
- [BMW](#)

[Google](#)

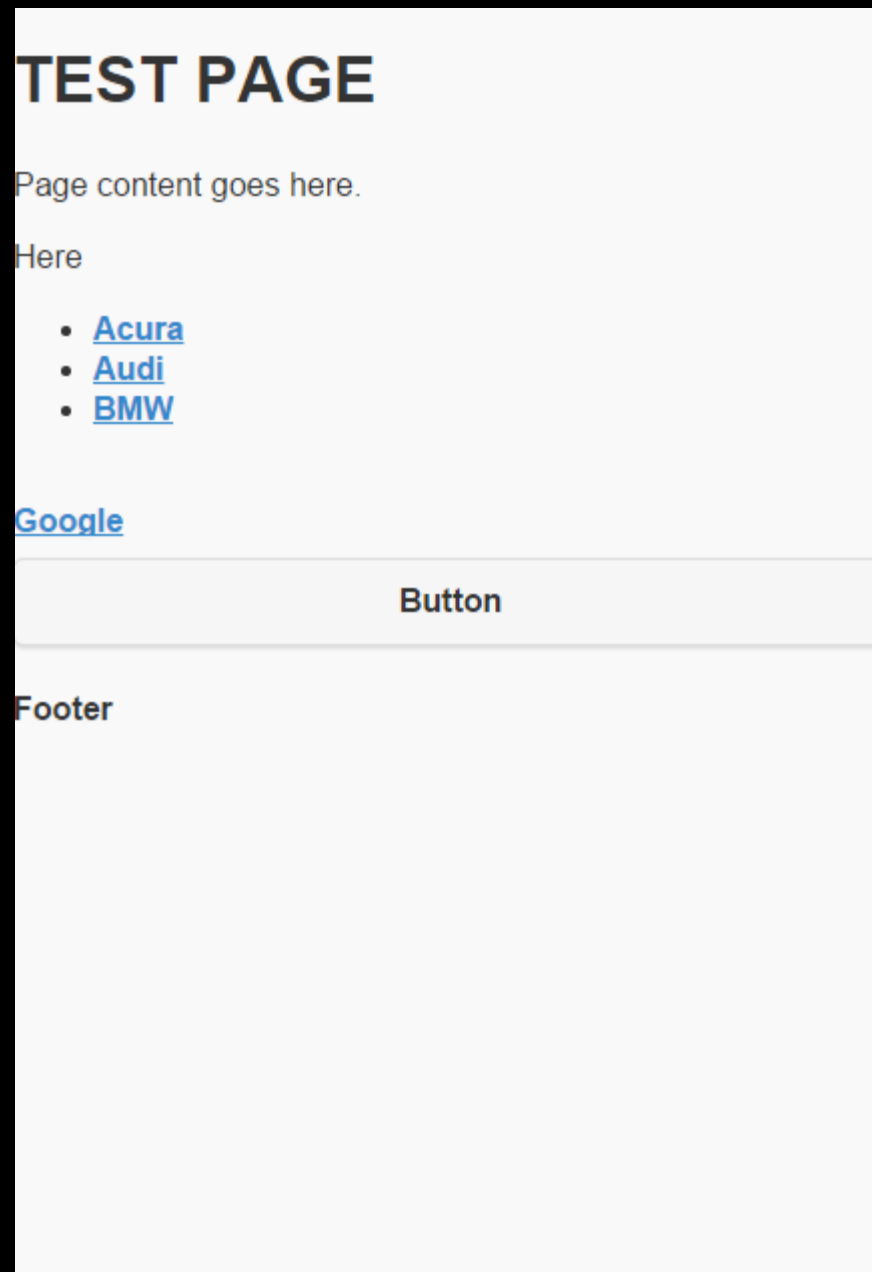

Button

Footer

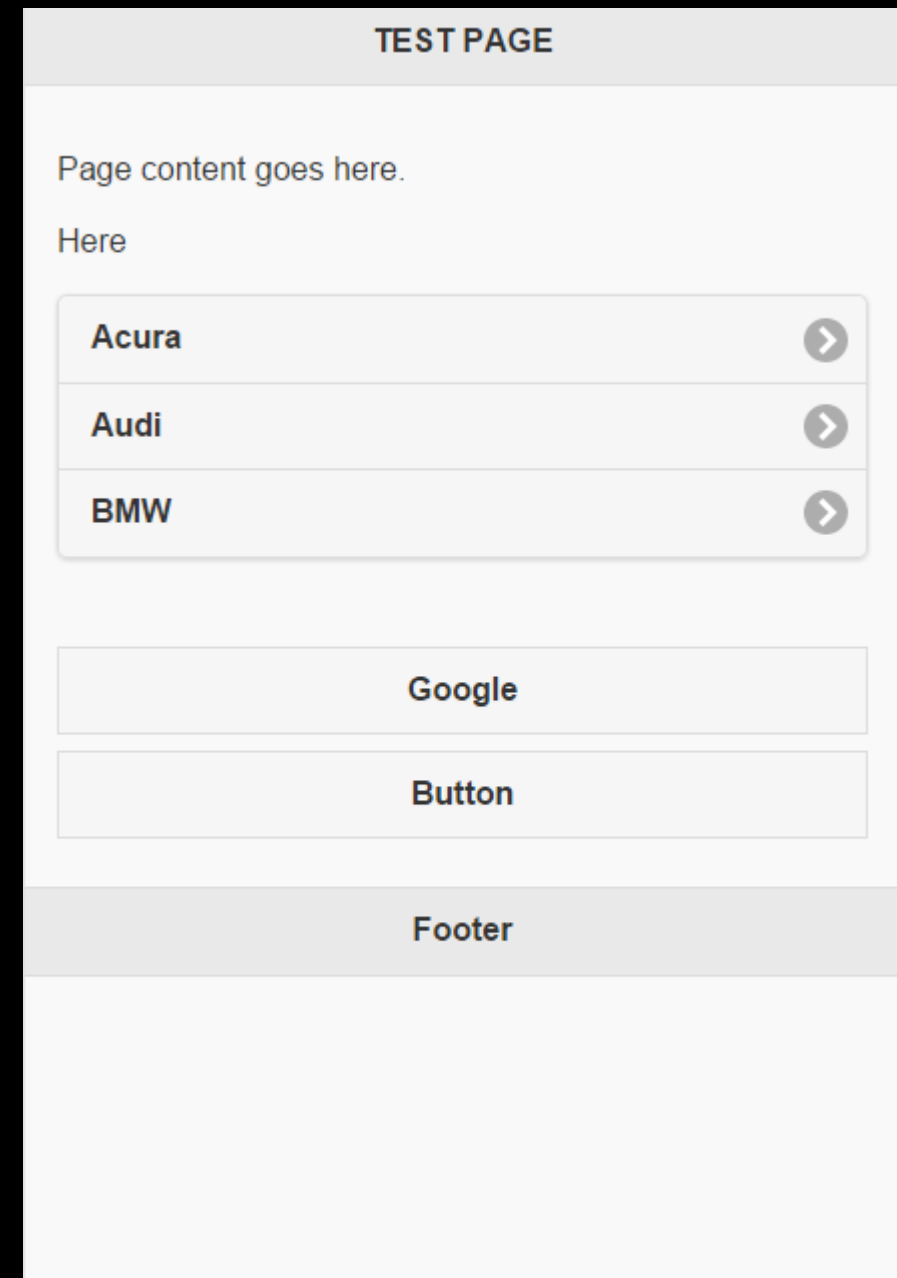

OPEN: index-starter.html

1. Use Data-Role to Renovate the Page

from Left

to Right

Stacking Pages

- You can have multiple mobile pages in the same HTML file
- Give each page a unique ID

```
<div data-role="page" id="contacts">
```

```
<div data-role="page" id="home">
```

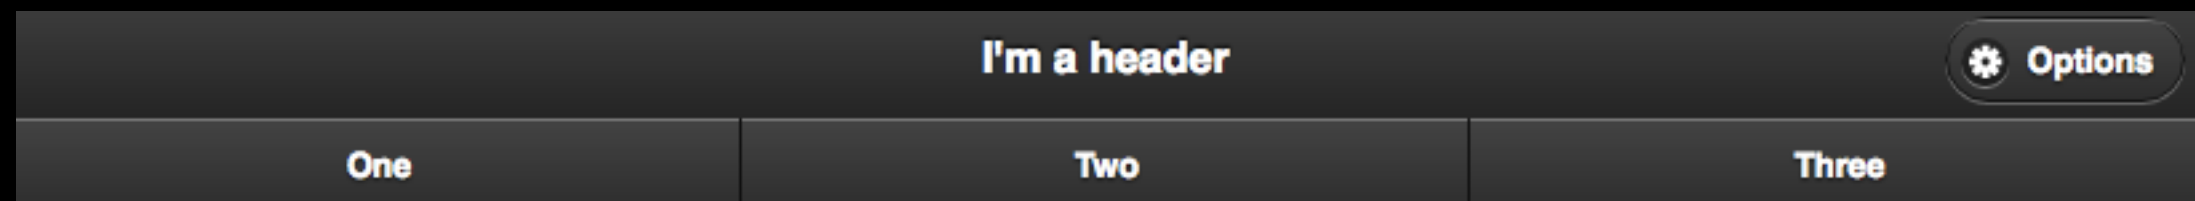

- Back button and/or navigation bar would be useful!

```
<a href="#home" class="ui-btn">Home (local link)</a>
```

- Hint: people like navbars

2. Add some pages and local links to your page.

3. Add a navigation bar to your page.

Buttons vs Links (Anchors)

- Links (with the `<a>` tag) go to other locations (internal or external)
- Buttons perform actions (e.g. forms, JavaScript events)

Transitions

- <http://demos.jquerymobile.com/1.0a4.1/docs/pages/docs-transitions.html>
- e.g. `<div data-transition="slideup">`
- Play around with these

Things We Haven't Covered

- Full feature list here: <https://api.jquerymobile.com/>
- You can change CSS, add event handlers and use special methods, and add some included icons
- The rest of this class is unstructured – use it to work on jQuery Mobile more with our help or meet with your teams about the upcoming assignment
